

Build & Deploy Your Portfolio Website in Under 5 Minutes

A complete step-by-step guide using AI + Vercel

What	A stunning, responsive personal portfolio website
How	Using an AI prompt (Claude / ChatGPT) + Vercel CLI
Time	Under 5 minutes from start to live website
Cost	Completely free
Skills Needed	Zero coding experience required

3 Simple Phases:

- 1. Generate** Paste a prompt into AI -> Get index.html
- 2. Download** Save the file into a folder called 'portfolio'
- 3. Deploy** Run 3 commands in terminal -> Website is LIVE

Phase 1 — Generate Your Portfolio

1 Open any AI Chat Tool

Go to one of these (any will work):

- **Claude** — claude.ai (Recommended)
- **ChatGPT** — chat.openai.com
- **Gemini** — gemini.google.com

Tip: Claude gives the best results for this. Use it if you can.

2 Copy & Paste This Prompt

Copy the entire prompt below and paste it into the AI chat:

You are a world-class portfolio website builder.

Ask me only these details:

1. Full Name
2. Job Title
3. Profile photo URL (or 'none')
4. Email
5. LinkedIn URL
6. GitHub URL (fetch my repos as projects)
7. Location
8. About yourself (2-3 sentences)
9. Work experience (company, role, duration, 2-3 achievements per role)
10. Education (degree, college, year)
11. Color theme (Blue/Green/Purple/Red/Orange)

Once I answer:

- Fetch GitHub repos as the Projects section
- Auto-extract skills from experience + repos
- Generate a SINGLE index.html file
(HTML+CSS+JS inline, no frameworks,
only Google Fonts as external dependency)

Design: Premium minimal (Apple/Stripe style),
dark mode toggle, smooth scroll, sticky navbar,
scroll animations, fully responsive.

Output ONLY the complete index.html file.

Important: Make sure the prompt says "**SINGLE index.html**" — this is critical. If it generates a .jsx or .tsx file, Vercel won't deploy it directly.

3 Answer the Questions

The AI will ask you 11 simple questions. Here's a sample:

1. Jayanth Babu
2. Full Stack Developer
3. `https://your-photo-url.jpg`
4. `your@email.com`
5. `https://linkedin.com/in/your-profile`
6. `https://github.com/yourusername`
7. Hyderabad, India
8. Full Stack Developer at ServiceNow.
Passionate about building web apps.
9. Sr. Software Engineer @ ServiceNow
(2022-Present)
 - Built enterprise SaaS features
 - Architected React + TypeScript systems
10. B.Tech, QIS College (2015)
11. Blue

Tip: For photo URL: Open your LinkedIn profile photo in a new tab and copy that URL. Or just type 'none' to skip.

4 Download the index.html File

After you answer, the AI generates your complete portfolio as a single **index.html** file.

- Click the **Download** button on the generated file
- Save it to your computer (remember where you saved it!)

Phase 2 — Prepare Your Folder

5 Create a Folder

Create a new folder on your Desktop called **portfolio**

On Mac:

```
mkdir ~/Desktop/portfolio
```

On Windows:

```
mkdir %USERPROFILE%\Desktop\portfolio
```

Or just right-click on Desktop > New Folder > name it **portfolio**

6 Move index.html into the Folder

Move (or copy) the downloaded **index.html** file into the **portfolio** folder.

Your folder should look like this:

```
portfolio/  
index.html <-- only this one file
```

Important: The file MUST be named **index.html** (not index(1).html or anything else).
Rename it if needed.

Phase 3 — Deploy to Vercel (Go Live!)

Prerequisites (one-time setup):

- Install **Node.js** from nodejs.org (download the LTS version, install it like any app)
- Create a free **Vercel** account at vercel.com (sign up with GitHub or Gmail)

7 Install Vercel CLI

Open **Terminal** (Mac) or **Command Prompt / PowerShell** (Windows) and run:

```
npm install -g vercel
```

Wait for it to finish. You'll see some text scrolling — that's normal.

Tip: If you get a permission error on Mac, try: **sudo npm install -g vercel** and enter your password.

8 Go to Your Portfolio Folder

In the same terminal, navigate to your portfolio folder:

On Mac:

```
cd ~/Desktop/portfolio
```

On Windows:

```
cd %USERPROFILE%\Desktop\portfolio
```

9

Login to Vercel

Run this command:

```
vercel login
```

It will ask you to choose a login method:

```
? Log in to Vercel
> GitHub <-- choose this if you signed up
GitLab with GitHub
Bitbucket
Email
SAML SSO
```

Select your option using arrow keys and press **Enter**. A browser window will open — confirm the login there.

You'll see **"Congratulations! You are now logged in."** in the terminal.

10 Deploy Your Website!

This is the magic moment. Run:

```
vercel --prod
```

Vercel will ask you a few questions. Here's exactly what to answer:

Question Vercel Asks	What You Type / Do
Set up and deploy?	Press Y then Enter
Which scope?	Press Enter (select your account)
Link to existing project?	Press N then Enter
What's your project's name?	Type portfolio then Enter (or any name you want)
In which directory is your code?	Press Enter (current directory ./)
Want to modify these settings?	Press N then Enter

Vercel will now build and deploy your site. In about 10-15 seconds, you'll see:

```
Production: https://portfolio-xxxxx.vercel.app
```

11 Open Your Live Website!

Copy the URL from the terminal and paste it in your browser.

That's it! Your portfolio is LIVE on the internet!

Share this URL with anyone — it works on all devices, has dark mode, animations, and looks professional.

Quick Reference — All Commands

Copy-paste these commands in order:

```
# 1. Install Vercel (one-time)
npm install -g vercel

# 2. Go to your folder
cd ~/Desktop/portfolio

# 3. Login (one-time)
vercel login

# 4. Deploy!
vercel --prod

# Done! Copy the URL and open in browser.
```

Troubleshooting

Q: "npm" is not recognized

A: You haven't installed Node.js yet. Download it from nodejs.org and install. Then restart your terminal.

Q: "permission denied" error

A: On Mac, add **sudo** before the command: **sudo npm install -g vercel**

Q: File shows as index(1).html

A: Rename it to just **index.html** before deploying.

Q: AI generated .jsx not .html

A: Add this to your prompt: "**Generate ONLY a single index.html file, no React, no JSX**"

Q: Website looks broken

A: Make sure the AI included all CSS and JS inline inside the single HTML file.

Q: Want to update the site

A: Edit index.html, then run **vercel --prod** again.
